Module - Character Arrays and 2D Arrays

Why need of Character Arrays?

Because using character variable we can save one character at a time

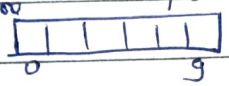
for example - Our Name - 'Ravi'

Strings → 1D Character Arrays terminated by '\0' character.

→ int a[10];

↳ 40 bytes

a = 100



int n;

for(i=0→n){

cin>>arr[i]; }

for(i=0→n) {

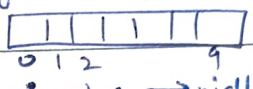
cout<<arr[i]; }

cout<<"\n"; → 100

→ char b[10]; { They behave little differently }

↳ 10 bytes

b = 700



cin>>b; → nidhi

cout<<b; → nidhi

null character

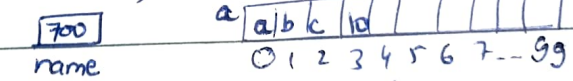
ASCII value = 0

↓

terminator

#

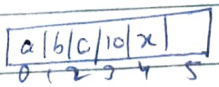
char name[100];



cin>> name; → abc

cout<< name; → abc

```
#include<iostream>
using namespace std;
int main(){
    char name[100];
    cin>>name;        → abc
    cout<<name;       → abc
}
```

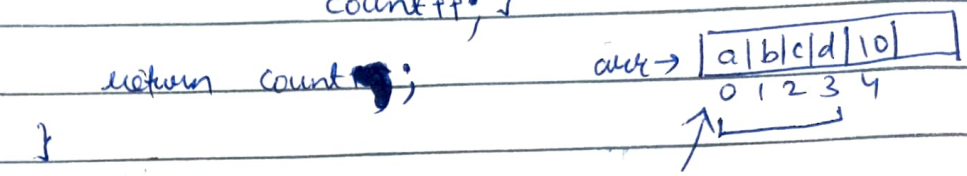


name[4]='x';

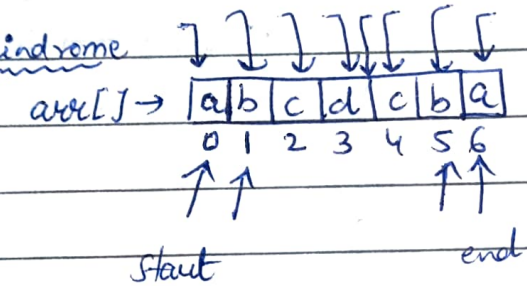
WOW!

Length of an Array

```
int length(char arr[]){ int count=0;
    for(int i=0; arr[i]!='\0'; i++){
        count++; }
    return count;
}
```



Check Palindrome



```
{
int start = 0, end= strlen(input) -1;
  while (start <= end) {
      if ( input[start] != input[end]) return false;
       start++;
       end--;
      }
   return true;
}
```

Replace Character

```
for(int i=0; input[i]!='\0'; i++){
        if (arr[i]==c1) {
            arr[i]=c2;}
        }
```

More About Character Arrays

char input[4]; (n → n+1)

_	_	_	\0
0	1	2	3

cin>>input;
- abcd ✗
- abc ✓
- ab ✓
- a ✓

cin>>input; → abcd → | a | b | c | d | \0 | (memory not mine — it may crash or may not)

cout<<input; → abcd

#

char arr[100];

n	e	l	l	o		w	o	r	l	d	\0

cin>>arr; → hello world → cin breaks on space, tab & enter (stops) taking input

cout<<arr; → hello

Alternative

cin.getline(string-name, len) ← no. of character it can enter

cin.getline(input, 100);
↳ hello world

cin.getline(string-name, len, delimiter) ← default '\n'

cin.getline(input, 100, 'o');
↳ Stops taking on encountering o

char a[10];
cin.getline(a, 10)
↳ 10 → 9
cin.getline(a, 4)
↓
3

hello world

1) input → [ ]
↓
reverse
↓
ip → hello world
op → dlrow olleh

input → | h | e | \0 |

cin.getline(input, len);

char input[10];
↓
10

WOW!

1) Reverse Character Array

f d c b a

input → | a | b | c | d | f | \0 |
0 1 2 3 4 5 6

output → | a | d | c | b | a | \0 |
0 1 2 3 4 5 6

start end
0 5 (len-1)
↓ ↓
start++ end--

```
void reverseString(char arr[]){
    int i=0, j= length(arr) -1;
    while(i<=j){
        swap(arr[i], arr[j]);
        i++;
        j--;
    }
}
```

Example

d c b a

① input → | a | b | c | d | \0 |
0 1 2 3 4

len = 5
i = 0 2
j = 4 3 2
temp = a

i=0 j=len-1

Trim Spaces

input → | a | b | c | | d | e | f | | g | | h | i | \0 |

Approach → index = 0

```
if(input[i] != ' '){
    input[index] = input[i];
    index++; }
}
input[index] = '\0';
```

Reverse WordWise

input → Welcome to Coding Ninjas

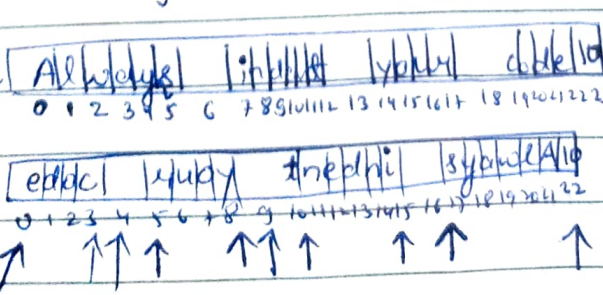
Output → sajniN gnidoC ot emocleW

→ Approach

```
void Reverse (char* arr, int start, int end) {
    while (start <= end) {
        swap (arr[start], arr[end]);
        start++;
        end--; }
    }

void ReverseWordWise (char* arr) { int len = strlen(arr) - 1;
    Reverse (arr, 0, len);
    int i = 0, start = 0, end;
    while (arr[i] != '\0') {
        if (arr[i] == ' ') {
            end = i - 1;
            Reverse (arr, start, end);
            start = i + 1;
            }
        i++;
    }
    Reverse (arr, start, len);
}
```

Example -



Code

WOW!

Inbuilt Functions (Strings)

1) Length of String → strlen(input) #include <cstring>

```
{
int input[100];
cin>>input;
int len=strlen(input);
cout<<len<<endl;
}
```

2) To compare two strings

↓

strcmp (str1, str2);

→ 0 (same) equal
→ non-zero (not same) not equal

	0	1	2	3
input1 →	a	b	c	\0
input2 →	a	c	b	\0
	0	1	2	3

i=0

input1[i] - input2[i]

97-97 = 0

98-97 = 1

97-99 = -2

```
if(strcmp(a1,a2)==0){
    cout<<"Equal"<<endl;}
else{
    cout<<"Not equal";
}
```

3) # To copy string → strcpy(string-name)

destination, source

a → hello

b → hello

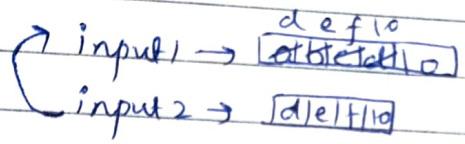
a=abc;
b=def;

strcpy(a,b);
cout<<a; → def

To showcase copying of two strings

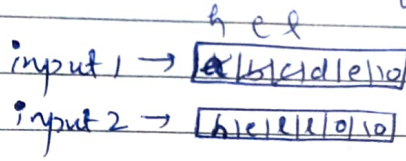
```
char arr1[100] = "abcd";
char arr2[100] = "def";
cout << "Before copying";
cout << "Input1:" << input1 << endl;
cout << "Input2:" << input2 << endl; strcpy(input1, input2);
cout << "After copying:";
cout << "Input1:" << input1 << endl;
cout << "Input2:" << input2 << endl;
```

Example



To copy first n characters of string into another string.

↳ It does not append \0 by itself.



strncpy (dest_string, source_string, n);
(input1, input2, 3)

input1 → abcd

all prefixes →
- a
- ab
- abc
- abcd

a → 0, 0
ab → 0, 1
abc → 0, 2
abcd → 0, 3

```
void AllPrefixes(char input[]){
    input[i] = '\0';
for(int i=0; i< len; i++){
    for(int j=0; j<=i; j++){
        cout << input[j];
    }
cout << endl;
}
```

WOW!

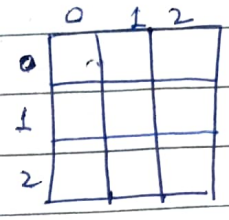
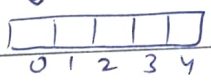
2D Arrays



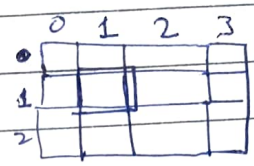
int arr[5];



arr[1] = 10;

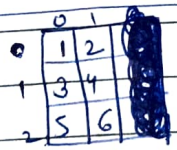
int arr[3][3]; Rows=3 columns=3

Rows columns

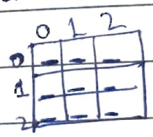


arr[1][1] = 10;

```
int arr[100];
int n;
cin>>n;
for(0 → n-1){
    cin>>arr[i]; }
for(0 → n-1){
    cout << arr[i];
```

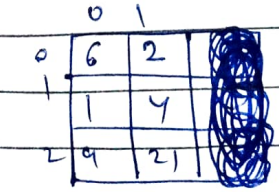


```
int b[100][100];
rows → m = 3
columns → n = 2
for(0 → 2){
    for(0 → 1){
        cin>>arr[i][j]; }}
```



arr[0][0]
arr[0][1]
arr[0][2]
arr[1][0]
arr[1][1]
arr[1][2]
arr[2][0]
arr[2][1]
arr[2][2]

```
for(0 → 1){
    for(0 → 2){
        cout << arr[i][j]; }}
```



6 1 9
2 4 21

```
for(0 → 2){
    for(0 → 1){
        cout << arr[i][j];
    } cout << endl;
}
```
